Roma Just Talk 元創盃組隊說明

給媽媽看｜2026 年 9 月 28 日｜尚未報名

媽，我想帶 Roma Just Talk 參加元智大學的「元創盃」。這是我正在做的 Mac 語音輸入軟體，已有公開測試版。比賽需要學生組隊，我想請妳介紹有興趣的元智學生給我。我會自己跟他們談要做什麼、能投入多少時間，再決定要不要一起報名。

Roma 做什麼

一般語音輸入要先按鍵再開口。用 Roma，可以先開始說，按下快捷鍵時，前面幾秒的聲音還在，不必為了漏掉句首重講。這是產品想解決的問題；我們還需要用實際測試證明它能穩定做到。

Roma 建立在開源專案 VoiceInk 上。我會在提案裡寫清楚原專案做了什麼、我已做了什麼，以及新隊友後來做了什麼。

比賽怎麼組隊

- 一隊要有 **3 至 6 位在學學生**，其中至少一半是元智學生，隊長也必須是元智學生。其他學校的學生可以加入，但要交在學證明。
- 我的學生身分還要確認。如果我不是在學學生，就不能算進參賽隊員人數；我會向主辦單位問清楚，能否以原專案負責人的身分協助學生隊伍。
- 指導老師可有可無。隊員必須知道自己要負責什麼，並親自同意參賽。專案權利和獎金分配要在組隊時談清楚。

Roma 已有產品雛型，適合報「實戰組」。初審有 20% 看已完成的成果。找來的同學可以做使用者訪談、測試 Mac 程式、整理提案，或準備決賽簡報。每個人都應有能拿出來的工作成果。

時間： 10 月 16 日 17:00 前交報名表及兩份 PDF。若晉級，11 月 11 日要參加提案診所，12 月 7 日 17:00 前交簡報，12 月 11 日到場簡報五分鐘、回答問題三分鐘。10 月 7 日有自由參加的工作坊，但公告與報名頁寫的時間不同，去之前要向主辦單位確認。

可以轉給學生的訊息

> 你好，Felix 想帶 Roma Just Talk 參加今年元智的「元創盃」，正在找願意一起做事的學生。Roma 是已有公開測試版的 Mac 語音輸入軟體，讓使用者先說話，再按快捷鍵保留句首。隊友可以協助訪談、測試、提案或簡報，不必每個人都會寫程式。比賽需要 3 至 6 位在學學生，元智學生至少占一半，並由元智學生擔任隊長。10 月 16 日 17:00 截止。Roma 建立在開源專案 VoiceInk 上，我們會如實交代來源和各人的工作。如果你有興趣，請寄信給 Felix，聊聊你想負責什麼、能投入多少時間：happyfumd@icloud.com。活動頁：https://johnnyweb-art.github.io/yzu-startup-challenge/

媽，請先幫我介紹至少三位有興趣的元智學生，不用替任何人答應參賽。我會處理接下來的資格確認和文件。

資料來源：活動頁、正式簡章、提案格式。

Roma Just Talk proposal for YZU Startup Challenge 2026

- **Team name:** [Choose with the student team; 20-character limit]
- **Project name:** Roma Just Talk
- **One-line description:** Speak before Shift.
- **Track:** Practical group
- **Field:** AI and information technology
- **Captain:** [YZU student, department and year]
- **Members:** [Names, departments, years, and actual roles]
- **Advisor:** [Optional]

Draft for discussion, not for upload. The final proposal must use the organiser's A4 PDF format. The team name, members, rights statement, and evidence are still open.

1. Summary

Roma Just Talk is a Mac dictation app for people who start speaking before they press a shortcut. With ordinary push-to-talk recording, the first words can be lost; the speaker then pauses, repeats them, or repairs the text. Roma keeps a short microphone buffer on the Mac. When the user presses Left Shift, the app can include those earlier seconds with the rest of the recording and insert the transcript into the active app. Users may choose local recognition or configure a cloud provider.

A beta Mac app and its source are public. What we cannot yet show is how often this problem occurs for other people, whether Roma solves it reliably in their daily work, or whether they would pay for it. The proposed student team would test those questions with Mac users who already dictate, improve the weakest parts of the setup and recording flow, and bring a measured demo to the final. We want introductions to potential testers and advice on Mac app distribution. Roma builds on the GPLv3 VoiceInk project; the proposal will identify VoiceInk's work, Felix's work before this competition, and what the student team adds.

2. Problem and market

Imagine someone drafting a message on a Mac. They start the sentence out loud, then reach for the dictation key. Recording that begins only after the key press misses the opening words. The person has to repeat them or edit the result. Roma addresses that moment.

We have not measured how often it happens. Our first research group would be 10 to 20 Mac users who already dictate several times a day. We would recruit through the public project and local student networks, watch them complete their usual writing tasks, and ask what they use now. We would record missed opening words, corrections, and whether they choose to use Roma again after two weeks. These observations would tell us whether the problem is worth solving before we estimate a larger market.

Typing, built-in Mac dictation, and established dictation apps are all credible alternatives. The question is whether keeping words spoken before the shortcut matters enough for people to change their routine.

3. Solution and technology

The user speaks, presses Left Shift, continues, then releases it to insert text. Roma's short rolling buffer lets the transcription path receive audio from before the key press. The app also has local speech-recognition choices and options for user-configured cloud providers. The product idea is the timing of the interaction. Roma does not claim to have invented a speech model.

Roma is a fork of VoiceInk. VoiceInk supplies much of the existing Mac app, and other open-source libraries support speech recognition and shortcuts. Roma's pre-roll interaction and its handoff from buffered to live audio are work done on the fork. Before submission, the team will attach commit links that separate upstream code, Felix's earlier changes, and new student work. The app remains subject to GPLv3 and the licences of its other dependencies. We will ask the organiser how to describe that history under the form's originality statement.

Local recognition can keep transcription on the Mac after any required model download. Cloud recognition sends audio to the chosen provider. The public beta also has release and privacy limitations, which we will state alongside the demo rather than ask judges to infer them from the source code.

Speech recognition is the AI function in the product. Felix has used generative AI tools while developing and documenting Roma and has made the product and acceptance decisions. The student team will record its own use of those tools for the final AI disclosure.

4. Existing work and validation

The source repository and v1.95.1 Mac beta are public. There is also a browser demo that explains the interaction. It uses the browser's speech recognition, so it cannot stand in for a test of the Mac app.

For this application, we still need a dated recording of the published Mac app capturing words spoken before the shortcut and inserting the result into another app. The separate evidence PDF will state the exact app version, Mac, macOS version, microphone, model, spoken phrase, and inserted text. We have no verified user count, retention result, sales figure, or measured advantage over another app to report here.

The student team will run the same short writing tasks with participants' current method and Roma. It will record the opening words captured, corrections, time to usable text, and failures. A judge should be able to see both successes and limits in those results.

5. Business model

Pricing is undecided. The beta is publicly downloadable, but that does not show demand for a paid product. We will ask frequent dictation users what they pay for now, where those tools fall short, and what they would pay for a reliable fix. We can then test one clear offer with interested users.

Any paid offer must respect GPLv3. The inherited code cannot be treated as exclusive property. Costs we need to measure include release signing, support, and any hosting used for cloud features. The public release is our starting distribution channel; we have not measured how many people it brings in or keeps.

6. Competition

Current option	Why people use it	What Roma needs to prove
Typing and editing	Familiar and precise; no microphone setup	Voice is useful for the tasks we target
Built-in Mac dictation	Already available on the computer	Lost opening words are common enough to justify switching
Established dictation apps	Mature recognition and workflows	Roma's timing benefit outweighs setup and trust costs

A shortcut can be copied. If Roma earns a place in someone's routine, it will be because the whole recording and insertion flow works reliably and the app is clear about permissions and data handling. We need to test that claim with users.

7. Team

Member	School and department	Work in this project	Relevant experience
[YZU student captain]	[Department and year]	Submission, interviews, team coordination	[Fill from actual work]
[Student 2]	[School, department, year]	Mac testing and demo	[Fill from actual work]
[Student 3]	[School, department, year]	Market research and pitch	[Fill from actual work]

[Fill this section after the students agree to join. Name any missing role. Keep Felix's work before the team formed separate from work done by entrants.]

8. Resources and next steps

Date	Work	Evidence that it is done
October 2026	Form the eligible team and submit	The centre sends its registration-success email
November 2026	Test first-word capture with Mac users	Consented task records, including failures and corrections
December 2026	Present the product	Five-minute pitch, three-minute Q&A, tested live demo and video backup
January 2027	Improve installation and first use	Published download tested on named Mac and macOS versions
March 2027	Decide what to offer users	Repeat-use results and responses to a specific price or offer

We would use the centre's help to meet prospective testers and speak with a mentor who knows Mac software distribution and open-source business models. The team will add a costed budget after it checks actual prices. We can consider FITI or U-start with the centre once the team and rights questions are settled.

Source and rights note

VoiceInk is the original GPLv3 Mac app. Roma is a public fork. The final proposal will cite upstream code and dependencies, Felix's existing commits, and each entrant's new work. The organiser's rules require disclosure of third-party technology and its licence. We will seek written guidance on how the existing fork fits the captain's originality declaration before signing it.

Roma Just Talk evidence preview

For the 2026 YZU Startup Challenge practical group. Draft for discussion, not for upload. The team name and Mac test results are still missing. The final evidence PDF will be separate from the proposal.

Public app

Roma's source code and v1.95.1 Mac beta are public. The beta was released on 11 September 2026. This establishes that there is an app to inspect and download. It does not, by itself, show the judge what happens when someone speaks before pressing Shift.

Still needed: Two dated screenshots from a run of the published app. Show the recording state and the text inserted into another Mac app. Beside them, give the exact spoken phrase and output, app version, Mac model, macOS version, microphone, and recognition model. If we use a newer development build, label it with its own version and commit rather than calling it the published beta.

Working demonstration

The browser demo code shows the interaction, but it uses browser speech recognition. It cannot prove the Mac app's recording and text-insertion path.

Still needed: A short recording of the Mac app capturing words said before the shortcut and inserting the full result. Check the exact public link without a login, and keep it available through the final on 11 December. Bring a local copy to the pitch in case the network fails.

Who made what

Roma builds on VoiceInk, which is licensed under GPLv3. The evidence file should credit that work. It should also show which changes Felix made before this competition and which changes the students make after joining.

Still needed: A short table with three to five relevant commits or design records, their dates, authors, and what changed. Ask the organiser how to present the existing fork and founder work under the captain's originality declaration. Do not attribute earlier work to new entrants.

What users say and do

We have no verified active-user count, sales figure, retention rate, or measured speed advantage to put in this file. If the team runs tests before submission, it will report the dates, number of people, exact task, results, and failures. Interviews can explain why someone would try Roma; they are not usage statistics.

The final PDF should contain only results we can trace to a test or public artifact. Check every link without signing in, keep student details private, make the text selectable, and stay below the 100 MB upload limit. The organiser recommends 20 MB or less.
